ALIEN No155

All species of garnets possess similar physical properties and crystal forms, but differ in chemical composition. ALIEN No155 is a mineral in the garnet group with the chemical formula $(\text{Mn}^{2+}, \text{Ca})_3(\text{Fe}^{3+}, \text{Al})_2(\text{SiO}_4)_3$. Also known as Calderite usually comes in dark reddish brown to dark yellowish in color and generally granular massive in form. It was named by a team of geologist that worked deep in the mountains of Albania looking for mysterious and unknown rocks. The name was first applied to a rock in manganese deposits in Micekus, then in early nineties described as a mineral in Sar mountains but later changed to Silicate garnet. Nowadays the rock transferred to DEEP GARNET laboratoties for careful examination where our technicians blended it with deep Techno sounds and darkish Deep-end Breaks.
