BORKA FM

All species of garnets possess similar physical properties and crystal forms, but differ in chemical composition. BORKA FM comes as Morimotoite, $\text{Ca}_3\text{TiFe}_2\text{Si}_3\text{O}_{12}$, and has been found in contaminated rocks which are considered to be a kind of endoskarn at Fuka, Bitchu-Cho, Okayama Prefecture, Japan. Morimotoite is derived from andradite and it is associated with calcite, vesuvianite, grossular, wollastonite, hematite, prehnite, fluorapatite, perovskite, zircon, baddeleyite and calzirtite. His sounds are Deep and Techy, balanced perfectly in the Deep-Breaks and Tech-Breaks hyperspace and were identified by DEEP GARNET RECORDS technicians inside contaminated rocks in Japan from where they're carefully examined and transferred to our laboratories. Morimotoites are adored by butterflies (for reasons that are not identified yet) while currently are getting further examination to our laboratories. New sound surprises can be expected soon....

DGR034 BORKA FM-Butterflies (with MR.KILLEN remix)

DGR035 PRODUKDo-Digital Foxtrot (with BORKA FM remix)
